

Aqua-Hort®

Preben Rousing, Vitting, Denmark use Aqua-Hort

Preben Rousing has with great success for several years used Aqua-Hort for production of vegetable young plants. The highlights are: **No spraying with chemicals and no crop losses.**

Two interesting developments in his use of Aqua-Hort are taking place.

1. Production of decorative edible pot plants

The picture shows Preben Rousing with one version of his edible pot plants. The three plants are: *Calendula officinalis*, *Tropaeolum majus* and *Borago officinalis*. They are all three meant to be put in salads.

When used in this way, the pot plants could never be sprayed with chemicals. Therefore can this production only take place when Aqua-Hort is employed to take care of the fungal and bacterial problems which might occur.

2. *Cylindrocladium* in *Crassula*

Cylindrocladium is normally a major pest in *Crassula*. With the use of Aqua-Hort can Preben Rousing keep his *Crassula* crop free off this disease. No chemicals are applied.

Recently has *Cylindrocladium* been a growing problem in hardy nursery stock production.
